News release

Hurricane Wilma reaches Mexico's Yucatan Peninsula

23 October 2005

At 7am UK time Sunday, the centre of Hurricane Wilma was located near 21.8 degrees North, 86.8 degrees West, about 55 miles north of Cancun, Mexico, or about 370 miles west-southwest of Key West, Florida.

Wilma is drifting slowly northeastwards and increase in forward speed is expected later today.

Maximum sustained winds are near 100 mph, with higher gusts. At present, Wilma is a Category 2 Hurricane on the Saffir-Simpson scale but some strengthening is possible today.

Hurricane force winds extend outwards up to 70 miles from the centre, Tropical Storm force winds extend outward up to 200 miles.

Wilma is expected to produce additional rainfall accumulations of 10 to 15 inches (250 to 380mm), through Sunday across portions of western Cuba and the Yucatan Peninsula, with isolated maximum storm totals approaching 50 inches (1200mm).

Large swells generated by Wilma continue to propagate into the eastern Gulf of Mexico and are likely to affect portions of the northern Gulf coast throughout Sunday.

Rainfall across southern Florida, including the Keys, up to the end of Tuesday, is expected to be 4 to 8 inches (100 to 200mm), with isolated maximum amounts of 12 inches (300mm) possible.

Storm surge flooding of 8 to 13ft (2 to 3m) above normal tide levels is possible along the southwest Florida coast and near to the south of where the centre of Wilma makes landfall. Storm surge flooding of 5 to 8ft (1 to 2m) is possible in the Florida Keys and Florida Bay.
